

Incident report analysis

Summary	The organization suffered a DDoS attack which compromised the internal network for 2 hours. The network services suddenly stopped responding due to an incoming flood of ICMP packets.
Identify	The company's cybersecurity team investigation found that a malicious actor had sent a flood of ICMP pings into the company's network through an unconfigured firewall. This vulnerability allowed the malicious attacker to overwhelm the company's network through a distributed denial of service (DDoS) attack.
Protect	To address this security event the network security team implemented a new firewall rule to limit the rate of the incoming ICMP packets and set the firewall to check for spoofed IP addresses on incoming ICMP packets.
Detect	To detect any upcoming abnormal traffic patterns, the network security has set up a network monitoring software to detect abnormal traffic patterns.
Respond	The incident management team responded by using An IDS/IPS system to filter out some ICMP traffic based on suspicious characteristics.
Recover	The team restored the critical network services.
